Package 'ggpage'

October 7, 2018

Type Package

Title Creates Page Layout Visualizations

Version 0.2.2
Description Facilitates the creation of page layout visualizations in which words are represented as rectangles with sizes relating to the length of the words. Which then is divided in lines and pages for easy overview of up to quite large texts.
Depends R (>= $3.0.0$),
Imports dplyr, ggplot2 (>= 2.0.0), stringr, tidytext (>= 0.1.0), magrittr, purrr, rlang
License MIT + file LICENSE
Encoding UTF-8
LazyData true
RoxygenNote 6.0.1.9000
Suggests testthat, knitr, rmarkdown, covr
VignetteBuilder knitr
NeedsCompilation no

R topics documented:
break_help

2 ggpage_build

Index 11

break_help

Repeating of indexes

Description

Repeating of indexes

Usage

```
break_help(x)
```

Arguments

X

Numerical, vector.

Value

Numerical.

Examples

```
break_help(c(1, 2, 3))
break_help(c(6, 8, 23, 50))
```

ggpage_build

Creates a data frame for further analysis and plotting

Description

This function can be used in combination with ggpage_plot to get the same result as ggpage_quick. However by splitting the data.frame construction and plotting we are able to do intermediate analysis which can be included in the visualization.

Usage

```
ggpage_build(book, lpp = 25, character_height = 3,
  vertical_space = 1, x_space_pages = 10, y_space_pages = 10,
  nrow = NULL, ncol = NULL, bycol = TRUE, wtl = NULL,
  para.fun = NULL, page.col = NULL, align = "left", line.max = 80,
  ...)
```

ggpage_build 3

Arguments

book Character or data.frame. Can either have each element be a separate line or having each element being separate words.

1pp Numeric. Lines Per Page. Number of lines allocated for each page.

character_height

Numeric. Relative size of the height of each letter compared to its width. vertical_space Numeric. Distance between each lines vertically.

x_space_pages Numeric. Distance between pages along the x-axis. y_space_pages Numeric. Distance between pages along the y-axis.

nrow Numeric. Number of rows of pages, if omitted defaults to square layout.

Numeric. Number of columns of pages, if omitted defaults to square layout.

bycol Logical. If TRUE (the default) the matrix is filled by columns, otherwise the matrix is filled by rows.

wtl logical. If TRUE will convert single word vector into a vector with full lines.

(defaults to FALSE).

para. fun Function that generates random numbers to determine number of word in each

paragraph.

page.col column to split the pages by.

align Type of line alignment. Must be one of "left", "right" or "both".

line.max Maximal number of characters per line. Defaults to 80.

... Extra arguments.

Details

The text MUST be presented in a column named text.

Value

'data.frame' containing the following columns:

- 'word': Character. The words of the text.
- 'page': Integer. Page number.
- 'line': Integer. Line number within the page.
- 'xmin': Numeric. Border of rectangle, used by ggpage_plot do not alter.
- 'xmax': Numeric. Border of rectangle, used by ggpage_plot do not alter.
- 'ymin': Numeric. Border of rectangle, used by ggpage_plot do not alter.
- 'ymax': Numeric. Border of rectangle, used by ggpage_plot do not alter.

Examples

library(dplyr)
library(stringr)
library(ggplot2)
library(tidytext)
library(ggpage)
build and plot
data.frame with full lines

4 ggpage_plot

```
ggpage_build(tinderbox) %>%
 ggpage_plot()
## vector with full lines
ggpage_build(book = tinderbox %>%
  pull(text)) %>%
  ggpage_plot()
## data.frame with single words
ggpage_build(tinderbox) %>%
  unnest_tokens(text, word) %>%
  ggpage_plot()
## vector with single words
ggpage_build(tinderbox %>%
  unnest_tokens(text, text) %>%
  pull(text)) %>%
  ggpage_plot()
# nrow and ncol
ggpage_build(tinderbox, nrow = 2) %>%
  ggpage_plot()
ggpage_build(tinderbox, ncol = 2) %>%
  ggpage_plot()
# Include analysis within
ggpage_build(tinderbox) %>%
  mutate(word_length = str_length(word)) %>%
  ggpage_plot(aes(fill = word_length))
```

ggpage_plot

Creates a visualization from the ggpage_build output

Description

Creates a visualization from the ggpage_build output

Usage

```
ggpage_plot(data, mapping = ggplot2::aes(), paper.show = FALSE,
  paper.color = "grey90", paper.alpha = 1, paper.limits = 3,
  page.number = character(1), page.number.x = 3, page.number.y = 3)
```

Arguments

data	data.frame. Expects output from ggpage_build with optional intermediate analysis.
mapping	Default list of aesthetic mappings to use for plot to be handed to internal ggplot call.
paper.show	Shows the paper underneath the text.
paper.color	Color of the pages. Needs to be of length 1 or the same as the number of pages.
paper.alpha	Alpha of the pages. Needs to be of length 1 or the same as the number of pages.
paper.limits	Numerical. Extends the edges of the paper in all directions.
page.number	Position of the page number. Defaults to none.

ggpage_quick 5

```
page.number.x Distance the page number is pushed away from the text along the x-axis.

page.number.y Distance the page number is pushed away from the text along the y-axis.
```

Value

A ggplot object with the given visualization.

Examples

```
library(dplyr)
library(stringr)
library(ggplot2)
library(tidytext)
library(ggpage)
# build and plot
## data.frame with full lines
ggpage_build(tinderbox) %>%
 ggpage_plot()
## vector with full lines
ggpage_build(book = tinderbox %>%
 pull(text)) %>%
 ggpage_plot()
## data.frame with single words
ggpage_build(tinderbox) %>%
  unnest_tokens(text, word) %>%
  ggpage_plot()
## vector with single words
ggpage_build(tinderbox %>%
  unnest_tokens(text, text) %>%
  pull(text)) %>%
  ggpage_plot()
# nrow and ncol
ggpage_build(tinderbox, nrow = 2) %>%
  ggpage_plot()
ggpage_build(tinderbox, ncol = 2) %>%
  ggpage_plot()
# Include analysis within
ggpage_build(tinderbox) %>%
  mutate(word_length = str_length(word)) %>%
  ggpage_plot(aes(fill = word_length))
```

ggpage_quick

Creates a quick visualization of the page layout

Description

Creates a quick visualization of the page layout

6 ggpage_quick

Usage

```
ggpage_quick(book, lpp = 25, character_height = 3,
  vertical_space = 1, x_space_pages = 10, y_space_pages = 10,
  nrow = NULL, ncol = NULL, bycol = TRUE)
```

Arguments

book Character or data frame. Can either have each element be a separate line or

having each element being separate words.

lpp Numeric. Lines Per Page. Number of lines allocated for each page.

character_height

Numeric. Relative size of the height of each letter compared to its width.

vertical_space Numeric. Distance between each lines vertically.

x_space_pages Numeric. Distance between pages along the x-axis.

y_space_pages Numeric. Distance between pages along the y-axis.

nrow Numeric. Number of rows of pages, if omitted defaults to square layout.

ncol Numeric. Number of columns of pages, if omitted defaults to square layout.

bycol Logical. If TRUE (the default) the matrix is filled by columns, otherwise the

matrix is filled by rows.

Value

A ggplot object with the given visualization.

Examples

```
library(dplyr)
library(stringr)
library(ggplot2)
library(tidytext)
library(ggpage)
# quick
## data.frame with full lines
ggpage_quick(tinderbox)
## vector with full lines
ggpage_quick(tinderbox %>%
               pull(text))
## data.frame with single words
ggpage_quick(tinderbox %>%
               unnest_tokens(text, text))
## vector with single words
ggpage_quick(tinderbox %>%
               unnest_tokens(text, text) %>%
               pull(text))
# nrow and ncol
ggpage_quick(tinderbox, nrow = 2)
ggpage_quick(tinderbox, ncol = 2)
```

line_align 7

line_align Adjust lines

Description

Adjust lines

Usage

```
line_align(line, max_length, type)
```

Arguments

line data.frame

max_length numerical. number of letters allowed on a line.

type Type of line alignment. Must be one of "left", "right" or "both".

Value

data.frame

nest_paragraphs

converts paragraph tokens into line tokens

Description

extents the str_wrap() function from the stringr package to work with longer strings.

Usage

```
nest_paragraphs(data, input, ...)
```

Arguments

data data.frame. With one paragraph per row.input column that gets split as string or symbol.... Extra arguments passed to str_wrap.

Value

data.frame.

8 paper_shape

page_liner

Add line number within pages

Description

Add line number within pages

Usage

```
page_liner(data)
```

Arguments

data

data.frame

Value

data.frame

paper_shape

Identify the edges of the paper of each page

Description

Identify the edges of the paper of each page

Usage

```
paper_shape(data)
```

Arguments

data

data.frame created by ggpage_build.

Value

data.frame,

Examples

```
paper_shape(ggpage_build(tinderbox))
```

para_index 9

para_index para_index	aragraph split
-----------------------	----------------

Description

Converts a word vector into a line vector with variable paragraph lengths.

Usage

```
para_index(n, FUN, ...)
```

Arguments

n Numeric. Numbers of words.

FUN Numeric. how many words to split whole string by.

.. Extra arguments.

Details

FUN most be a function that takes in a number n and returns a vector of natural numbers.

Value

Numeric. paragraph indicator.

tinderbox	The tinder-box by H.C. Andersen	

Description

A tidy data.frame containing the entire story of The tinder-box by H.C. Andersen with two columns: text which contains the text of the fairy tale divided into elements of up to about 80 characters each and book giving the name of the fairy tale in question.

Usage

 ${\tt tinderbox}$

Format

A data frame with 211 rows and 2 variables:

text character string up to 80 characters each

book name of the fairy tale ...

10 word_to_line

tinderbox_paragraph The tinder-box by H.C. Andersen

Description

A tidy data.frame containing the entire story of The tinder-box by H.C. Andersen with two columns: text which contains the text of the fairy tale divided into paragraphs.

Usage

```
tinderbox_paragraph
```

Format

A data frame with 11 rows and 1 variables:

text character string up to 80 characters each ...

word_to_line

Internal function for converting words to lines

Description

extents the str_wrap() function from the stringr package to work with longer strings.

Usage

```
word_to_line(words, wot_number = 1000)
```

Arguments

words data.frame. Where each row is a separate word words with the column name

text.

wot_number Numeric. how many words to split whole string by.

Value

Character. have each element be a separate line.
